

UPPER HUDSON RIVER

Community Water Quality Monitoring Results

2016-2020

More: Explore a watershed map, data from each sampling site, and more at www.riverkeeper.org/water-quality/citizen-data/upper-hudson-river

Community Science

The water quality data presented here are based on an analysis of 506 samples collected by watershed residents and staff of Jarrett Engineers. Samples were collected in June, August & October of 2016, and from May to October in 2017-2020, and processed by Riverkeeper. To get involved, contact Sebastian Pillitteri at spillitteri@riverkeeper.org.

Why We Measure Bacteria

Fecal indicator bacteria such as *Enterococcus* (“Entero”) usually do not make us sick. But because they live in the guts of warm-blooded animals, when these bacteria are present in water, pathogens that can make us sick may also be present.

Sources of fecal bacteria may include sewer overflows and failures, inade-

quate sewage treatment, urban or farm runoff, septic system failures, wildlife and contaminated sediment.

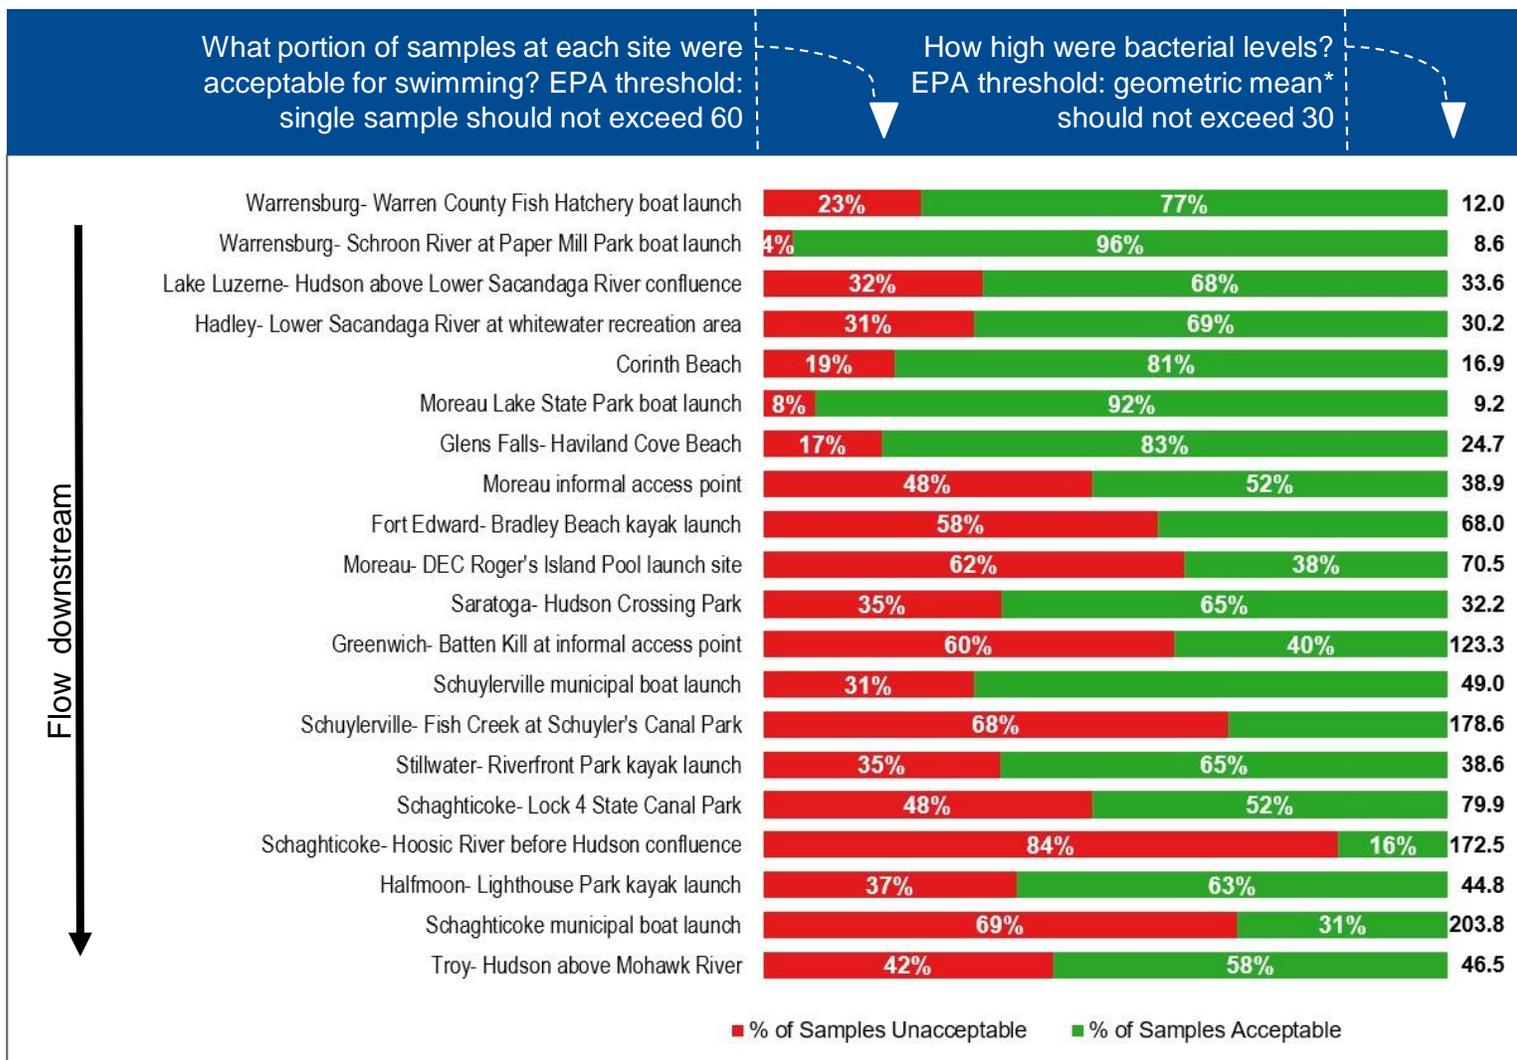

While research continues, the EPA has set thresholds to define if water is safe for swimming based on decades of science relying on measurements of these bacteria. Data are shown in Entero cells per 100 mL.

About the Upper Hudson River

The Hudson River begins at Lake Tear of the Clouds, on New York’s highest peak, Mount Marcy. The “upper” part of the river is the portion above of the Federal Dam at Troy, which forms a barrier to the tides. More than 83,000 people use the Upper Hudson as a drinking water source.

Signs of Progress

As part of a growing community science program, the Media Sanctuary NATURE Lab Water Justice Fellows will process samples for the Upper Hudson. This will be part of a program that explores water justice with local youth in Troy, at the confluence of the Upper and Hudson River.

*The geometric mean (GM) is a weighted average of all samples.
