Community Science

The water quality data presented here are based on an analysis of 1659 samples collected and processed since 2015 by volunteers, Riverkeeper, SUNY Cobleskill, and SUNY Polytechnic Institute. Samples are collected monthly from May to October. If you would like to get involved with sampling contact Sebastian Pillitteri at spillitteri@riverkeeper.org.

Why We Measure Bacteria

Fecal indicator bacteria such as Enterococcus ("Entero") usually do not make us sick. But because they live in the guts of warm-blooded animals, when these bacteria are present in water, pathogens that can make us sick may also be present.

Sources of fecal bacteria may include sewer overflows and failures, inade-

quate sewage treatment, urban or farm runoff, septic system failures, wildlife and contaminated sediment.

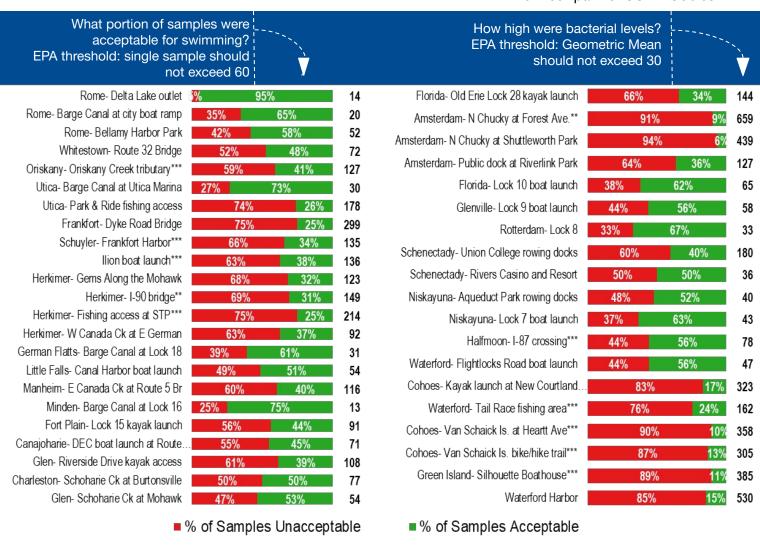

While research continues, the EPA has set thresholds to define if water is safe for swimming based on decades of science relying on measurements of these bacteria. Data are shown in Entero cells per 100 mL.

About the Mohawk River

The Mohawk River is the largest tributary to the Hudson River and is also the Erie Canalway. More than 100,000 people use it as a source of drinking water.

Signs of Progress

The Town of Amsterdam has received a grant to study connecting sewers to homes along the Chuctanunda Creek, a tributary to the Mohawk River. This is a positive step to eventually reduce the untreated sewage entering the creek and eventually the Mohawk River. This was a direct result of the Friends of the Chuctanunda Community Group, and monitoring from our partner SUNY Cobleskill.

Sampling began in 2015 and expanded in *2016, **2017, ***2018
